Definition Of Done

This project aims to deliver an accessibly interfaced and easily installed system, which can take a frame from a universal camera source, on as many devices as is feasible and then run inference on the frame. This should then return an audio output based on the inference. The return information should be based on one of two switchable contexts. One acting as a visual aide (aide mean assistant and not a medical device) delivering relevant information about the hazards and terrain around those with visual impairment. The other mode returning a rich descriptive experience, allowing the user to have worldly subtitling.
